GD160 Assignment #4 Dreamweaver

You will create a basic 2 page website. There will be a persistent navigation in place for both pages. There will be different content on the pages.

Information page – This page will provide some textual information. It should include some text as well as one of your business card flash animations. There should be a link(text or image) to the gallery page.

Gallery page – You will create an image gallery of at least five different images. This page should contain the thumbnail images of those five images and should link to the large versions of the images. There should also be a link(text or image) to the information page.

You will create your two pages and style them accordingly. You will turn in the entire root folder structure so that your website can be viewed on any other machine. Inside your root folder structure should be all the files necessary to view the website. The root folder you turn in to me should be named using the usual naming structure: class+section+lastname+AS04. For example, a student named John Smith in GD160 section B would turn in a folder called **gd160BsmithAS04** and in that folder would be all the files that make up the website.
